Abstract – In today's digital era efficient management of library inventories is imperative to streamline operation and improve user experience. This abstract introduces an innovative Library Inventory Management System utilizing Radio-Frequency Identification (RFID) technology to revolutionize the traditional library materials, enabling automated tracking, identification, and management of library resources. RFID readers strategically positioned throughout the library enable real time inventory updates, eliminating the need for manual scanning of individual items. The collected data is seamlessly integrated into a centralized database, facilitating accurate and instantaneous inventory checks.

Key Words: RFID, database, RFID reader, tracking

1.INTRODUCTION (Size 11, Times New roman)

In today's rapidly evolving world, efficient and innovative library management are vital to streamline the process of organizing, tracking, and ensuring the accessibility of books and other library materials. Traditional library method often struggle to meet the growing demand for quick and accurate book sorting, checking in and out, and maintaining inventory. To address these challenges, our project introduces an RFID based book sorting system with read-in and out features.

The primary goal of this project is to enhance the overall efficiency and accuracy of library management by harnessing Radio-Frequency Identification (RFID) technology. Our RFID based book sorting and inventory management system not only enhances the operational efficiency of libraries but also improves user experiences. This paper represents a significant step towards modernizing library operations and making the library experience more convenient and enjoyable for everyone.

2. Body of Paper

The proposed methodology for implementing a book sorting system with RFID-based read-in and read-out features, along with book counting capabilities, involves several key steps. Firstly, the system will require the installation of RFID readers and tags within the library.

Each book in the library will be tagged with a unique RFID tag, containing book specific information. When a patron checks out a book, the RFID reader at the library entrance will record the book's RFID tag information, marking it as "checked out" in the system. Similarly, when the patron returns the book, the RFID reader at the return point will update the status to "checked in." Additionally, RFID readers placed at sorting points within the library will be used to sort the returned books into appropriate categories based on predefined criteria. The methodology combines RFID technology with database integration to streamline book sorting, tracking, and inventory control in a library setting, ultimately improving efficiency and user experience.

Fig-1: Block diagram of the System

The operation is executed in three stages. The first ac is converted into 12v dc. At the second stage by using RFID Tags and barcode scanner the signal is sent to the microcontroller. At the third stage data is stored in the system and indicator unit works.

The project setup consists of a power supply unit, indicator unit. The power is supplied through 230/12 volts transformer later voltage is regulated to 5v and RFID tags and reader are supplied with 5v which is interfaced with Arduino in such a way that if a RFID reader detects a RFID unique number and sends the number and sends the signal to Arduino board, by this Arduino sends the corresponding command to the serial port which is connected to the system which stores the data in datasheet with various parameters of the user. The purpose of LCD is to display the book details to the operator. The program to Arduino is written with respect to RFID Tags and Readers, by the signal of the readers

and tags, Arduino is programmed to work on the respected RFID Tags

3. CONCLUSIONS

Conclusively, the implementation of Library Inventory Management System utilizing Radio Frequency Identification technology offers substantial benefits to libraries. The utilization of RFID streamlines inventory processes, enhances security and improves patron experience. Through RFID, libraries can automate tasks, reduce manual errors and optimize the staff productivity.
